

Hand-over Note

Mehfil Event Planners – Wedding Survey

Item	Details
Prepared by	Anis, Web Development Intern, EZItech Software House
Client	Mehfil Event Planners
Live site	https://YOUR-USERNAME.github.io/mehfil-survey/
Repository	https://github.com/YOUR-USERNAME/mehfil-survey
Hosting	GitHub Pages (branch main, folder /)

1. What is being delivered

A four-step wedding preferences survey (contact, wedding details, style and services, review and submit) hosted free on GitHub Pages. It includes a progress bar, live validation, save-and-resume in the visitor's browser, a review screen with Edit buttons, and a mobile-friendly design.

2. Important: submissions are not delivered yet

The Submit button currently posts to a **test service** (JSONPlaceholder). It shows a thank-you message, but **no answers reach Mehfil Event Planners**. The survey must be connected to a real destination before it is shared with customers.

3. Next steps for the client

#	Action	How
1	Connect a real submission endpoint	Choose a form service (for example Formspree or Google Apps Script) or a small backend. Change SUBMIT_URL at the top of app.js. Send a test entry and confirm it arrives.
2	Check the reply format	The page treats any 2xx reply as success. If the service replies differently, adjust showSuccess() in app.js.
3	Review wording and options	Confirm budget ranges, style options, services and required fields with the team (index.html).
4	Add branding	Replace bg.svg with an official photo (bg.jpg) and confirm colours in style.css.
5	Add a privacy notice	The survey collects names, email and phone. Add a short notice on how the data is used.
6	Optional: custom domain	GitHub Settings, Pages, Custom domain; then add the DNS record at the domain provider.
7	Optional: analytics	Add a privacy-friendly analytics script to see how many visitors finish the survey.

4. How to update the site

- Edit the files (in a text editor, or on GitHub with the pencil icon).
- Commit and push to the **main** branch.
- GitHub Pages redeploys within a minute or two. Refresh with Ctrl+F5 to see changes.

5. Ownership and access

- Make sure the client organisation owns the GitHub repository, or transfer it (Settings, General, Transfer).
- Give named team members access under Settings, Collaborators.
- Turn on two-factor authentication for the GitHub account.

6. Known limits

- Saved answers live only in the visitor's browser. Clearing browser data or switching devices removes them.
- Google Fonts and the submit request need an internet connection.
- GitHub Pages serves static files only; it cannot store answers or send emails by itself.
- The Pages site is public. Do not put private information in the repository.
